

A Metal Building for Any Purpose

One of the best features of metal buildings is their versatility. Available in multiple models, metal buildings can be used for just about any purpose.

Metal buildings are your ideal choice whether your needs run to a backyard workshop or a small airplane hangar.

If a backyard workshop is what you need, the P series of metal buildings gives you a more traditional structural style with straight sidewalls and arched roof. Since the arch is raised to above the sidewalls, the P series offers optimal usable space along with the typical strength and durability of arched metal buildings. If you live in a high snow and wind area, the 4 to 12 pitch roof of the A series of metal buildings offers ideal protection for your workshop, storage area or garage.

The S series of metal buildings gives you 100 percent usable space with its high, straight sidewalls and arched roof. More vertical and floor space is on offer with an S series metal building design, making this style attractive for industrial, manufacturing and commercial purposes as well as for airport fueling stations and even fire stations. They are large enough to hold a recreational vehicle, should you need space to store your RV when not in use.

The rounded corrugated arch structure of the Q series metal buildings (otherwise known as [Quonset huts](#)) provides unbelievable strength as one of the strongest structures in architecture, able to withstand hurricanes, tornadoes, earthquakes and heavy snow. The versatility of this metal buildings design makes it great for storing either grain or airplanes.

Metal buildings can be used for all sorts of agricultural purposes. More commonly referred to as pole barns, this type of metal building can withstand the elements while providing optimal protection for hay, grain and crop storage and shelter for farm animals and livestock. If you need a machine shed, no problem; pole barn metal buildings work great for that purpose, too.

Pilots of small airplanes can easily and conveniently house an airplane and related servicing equipment in a metal building designed specially for that purpose. You can erect an airplane hanger simply by bolting the steel panels together. These metal buildings provide an energy efficient environment and cost less to cool in the summer and heat in the winter while protecting your airplane and maintenance equipment from the elements.

So, whatever your purpose, metal buildings easily fit the bill. You are guaranteed to be pleased with the results. More Reading [Arch steel buildings](#) ... [Steel aircraft hangars](#) ... [Metal building kits](#) ... [Metal building manufacturer](#) ...
